Chapter 13: How many Notes

How many

This is a fairly easy and fun chapter about the shapes that you have learned in the previous chapters and find out the answer to the question given with the help of beautiful coloured pictures. The chapter may also introduce the idea of estimation, helping students make educated guesses about quantities without counting each item individually. This nurtures their intuitive understanding of numbers and quantities.

Question:

Cost of one banana is 1 rupee, find the cost of 3 bananas.

Answer:

Cost of 1 banana = 1 rupee then,

Cost of 3 bananas = 1 rupee + 1 rupee + 1 rupee
= 3 rupees

Question:

Cost of one apple is 5 rupees find the cost of 4 apples.

Answer:

Cost of one apple = 5 rupees

Cost of 4 apples = 5 rupees + 5 rupees + 5 rupees + 5 rupees
= 20 rupees

To simplify the process of counting larger numbers of objects, students might be introduced to the idea of grouping. For instance, objects could be grouped in tens, making it easier to count large quantities. This method lays the foundation for place value and base-ten counting in higher grades.

To reinforce the concepts learned, students engage in various exercises and activities, ranging from counting objects in a picture, matching groups of objects to the correct number, to solving simple word problems related to quantities.

Question:

Find the bigger number 13 and 26.

Answer:

26 is bigger than 13.

Question:

Find the bigger number 52 and 68.

Answer:

68 is bigger than 52.
